

HOMEWORK ASSIGNMENT #4

RealSense

Due Date: 11:59am on 05/03/2016

Please read the submission guideline (posted on the class website) carefully before getting started.

All images in this homework can be downloaded from our class website: <https://ceiba.ntu.edu.tw/1042DIP>. Images are in the raw file format. The size of each image is listed in the appendix.

For MATLAB users, you are **NOT** allowed to use the MATLAB Image Processing toolbox **except the imshow() and image() functions.**

DEPTH MEASUREMENT EVALUATION OF YOUR REALSENSE CAMERA:

Use the **white box of the RealSense** to estimate the **noise of the depth images** acquired by your RealSense camera in the following way:

- (a) Capture **300 depth images** of the white box and **crop each image so that** each cropped image contains **only the white box**, as shown in Figure 1.
- (b) Calculate the standard deviation for every pixel of each cropped depth image and save it as a 2D array of positive real numbers.
- (c) Compute the mean and variance of the 2D array of standard deviation.
- (d) **Quantize the 2D** array of standard deviation and save it as an **8-bit grayscale** image so that its value of **255 corresponding to the max standard deviation.**
- (e) Enhance the above image with **histogram equalization** and display the image before and after the enhancement as shown in Figures 2 and 3.
- (f) Plot the histograms before and after the histogram equalization as shown in Figures 4 and 5.

Repeat the steps for **four distances** between the camera and the white box (more precisely, for distance of **200, 300, 500, and 800 mm**). For each distance, please show the followings in the report:

- (1) The **mean and variance** of the 2D array of standard deviation.
- (2) The max standard deviation for quantization.
- (3) The **grayscale standard deviation** image and equalized grayscale standard deviation image as shown in Figures 2 and 3.
- (4) The histograms before and after the histogram equalization as shown in Figures 4 and 5.
